

Brixen Consultants CMS & Client Portal

Full product documentation for the live system at <https://portal.brixenconsultants.com>.

This portal is the Brixen Consultants CRM (staff) and client workspace. It is linked to the public website <https://brixenconsultants.com> (WordPress + WooCommerce) for signups, checkout orders, and Normal-customer website login.

1. What this system is

The CMS is a single-page Flask/WSGI application (`app.py`) with:

- Staff CRM for customers, companies, orders, invoices, documents, tasks, and accountancy
- B2B client portal login (same domain)
- Normal (retail) customers who sign in on the **website**, not this CRM
- Companies House lookup, KYC documents, invoices, and transactional email
- WordPress webhook + SSO so website orders and users appear in the CRM

Live URL: <https://portal.brixenconsultants.com>

Website: <https://brixenconsultants.com>

App process: systemd `brixen-crm` on `127.0.0.1:5050` behind Nginx/SSL

Database: SQLite file `hypetex.db` (never overwritten by code deploys)

2. Who can sign in, and where

Account type	How they are created	Where they log in	What they see
Super Admin / Admin / Manager / Staff	Staff → Create Account, or existing portal user	This CRM portal	Staff sidebar (Overview, Customers, Companies, Orders, etc.)
B2B Customer	Create Customer → B2B, or converted client	This CRM portal	Client sidebar (Dashboard, Company Registered, Orders, ...)
Normal Customer	Create Customer → Normal, or website signup	Website only (<code>brixenconsultants.com</code> client panel / my-account)	Not this CRM. Website login is provisioned in WordPress

Rules coded in the app:

- Normal clients are blocked from CRM portal login (`client_can_use_crm_portal`).
- B2B clients can use the CRM portal; they get a unique `B2B-XXXXXX` ID.
- Passwords must be at least **10 characters**.

- Forgot password emails a reset link for B2B and staff. Website customers are directed to the website login.
 - Super Admin can force-delete locked genuine records. Other staff cannot wipe locked orders/companies/invoices.
-

3. Staff CRM — screens and what they do

3.1 Overview (admin dashboard)

Performance snapshot: sales, customers, products, revenue charts, top performers. Uses batched queries (not N+1) so the dashboard stays fast.

3.2 Customers / Signups

Lists all `CLIENT` users (Normal and B2B), with company/order counts.

Create Customer

1. Choose **Normal** or **B2B**.
2. Enter name, email, phone, country, password (min 10 characters, confirmed).
3. Submit creates/updates the CRM user.

Behaviour:

- **B2B**: CRM portal account + `B2B-XXXXXX`. They sign in here.
- **Normal**: CRM record + WordPress website login via `/wp-json/brixen-crm/v1/provision-customer`. They sign in on the website only.
- If the email **already exists** as a client, Create Customer **updates** name, phone, and password instead of failing with “Could not create customer”.
- If WordPress sync fails, the CRM record is still saved and a warning is shown (not a hard red failure that hides the saved customer).
- Permanently deleted emails cannot be recreated (see §11).

Staff can also set phone, notification email, portal/website password, status, and delete (permanent for Super Admin / authorised staff).

3.3 Company Registered

UK company cards for the whole book (staff) or the logged-in B2B client.

Default front view

- Opens on **registered companies only** (Companies House records).
- **Newest registration first** (`created_at` , then incorporation date, then id).
- Pending / “not registered yet” cards are on the **Not registered** or **All** filters, not on the landing view.

Filters

Filter	Shows
Companies House	Official numbered UK companies, newest first
Attention	Overdue accounts, confirmation statement, default CH address, strike-off
Not registered	Awaiting a Companies House number / name confirmation
All	Registered companies first, then pending

Click a company

Opens the company sheet on **Overview**: name, number, registered address, status, country, incorporation date, director(s), verified business email, WhatsApp.

Other tabs: Registered Office, Business Activity (SIC), Compliance (UTR / auth / activation / IDV / PSC), Orders / Services, Documents.

Staff can:

- Add company (Companies House search)
- Import WebFiling company numbers
- Bulk edit / bulk delete (delete is permanent for Super Admin)
- Confirm pending formation names so a card becomes a registered company

Genuine locked registered companies are not auto-deleted by scripts.

3.4 Accountancy

Identity verification, PSC, registered office, year end, due dates, cash book, bank-statement upload, and yearly accounts filing (Companies Act / Companies House workflow).

3.5 Orders Manager

Every website and CRM order.

- Search/filter; product summary from line items
- Open an order: customer, company owner, products, documents, payment plan, internal notes, conversation
- Super Admin can change price (listed price = total; **no VAT**)
- Super Admin can force-delete locked genuine orders
- Manual Super Admin deletes are **permanent** (ledger + backup scrub)

Create New Order (5-step wizard)

1. **Customer** — staff pick a client (clients skip this; they are the customer).
2. **Service** — select **one or more products**. A tray shows the selection.
3. **Details** — one shared form. Duplicate fields from different products are asked **once**. Required wins if any selected product needs the field.
4. **Documents** — merged checklist. For packages, banks, address, identity / formation services: **ID** and **Proof of Address** required; **Additional Documents** optional.
5. **Review** — listed total, **No VAT**, then submit.

The result is **one order** with multiple **line items**.

Drafts can be saved. B2B prices show as custom rate until staff set them.

3.6 Tasks & Team

Internal tasks by department, assignee, client/company/order links. Team list for staff accounts. Incentive / SLA report on the Performance dashboard.

3.7 Services Catalog

CRM catalogue (name, category, price, duration, status). Website WooCommerce prices stay separate unless products are synced.

New services store `vat_rate = 0`. Order totals do not add VAT.

3.8 Payment / Invoices

Invoices linked to orders. Timing: After work, Advance, or Deposit.

- Amount = listed price
- Tax/VAT = **0**
- Total = price
- GBP Tide and PKR UBL details on payment emails
- Paid / part-paid / overdue; send invoice / payment-received emails to the **company owner** email, not necessarily the portal login

3.9 Documents Review

Lifecycle:

Customer Uploads → Processing → Review Required → Ready for Approval → Posted Documents

Quarantine for problem files.

Staff can approve, quarantine, promote into the company vault, and download.

3.10 Smart Intake

Drop unorganised files (passports, statements, formation packs). OCR / profile match against Companies House. Google Drive folder import is supported.

3.11 Audit Logs

Staff actions: logins, creates, deletes, password sets, document reviews.

3.12 System Settings

Brand, logo, support email/phone, prefixes, SMTP, Companies House API key, compliance alert toggle (default off until enabled).

3.13 Performance

Staff leaderboard, SLA on-time %, incentive tier.

4. B2B client portal — screens

Available only to B2B clients who log in at the portal.

Screen	Purpose
Dashboard	Greeting from the browser local clock (morning / afternoon / evening). Empty state is a glossy welcome. Recent orders/companies.
Company Registered	Same card model as staff, scoped to that client. Newest registered first. Click for official details.
Accountancy	IDV, PSC, year end, due dates for their companies.
Addresses	Registered / trading / virtual office subscriptions.
Orders	History + Create New Order (same multi-product wizard, customer step skipped).
Invoices / Payments	Their bills and receipts (no VAT line).
Documents	Vault upload/download.
Services	Active catalogue.
Order Support / Messages	Tickets and advisor thread.
Profile	Contact details and password.

Normal customers never see this CRM UI.

5. Create New Order — detailed rules

5.1 Multi-product

- Tick as many catalogue products as needed.
- Selected chips can be removed without restarting.
- Submit stores `line_items` (product name, category, price) on one order.
- Order title is the product name if one item, or **Multiple Products** if several.
- Notes include the product list.

5.2 Merged requirements

If two products need the same field (for example company name or SIC), it appears **once**. If either product marks it required, it stays required.

Repeatable sections (shareholders, etc.) are merged by id and asked once.

5.3 Documents

Packages, banks, address, identity, KYC, incorporation, formation, mail forwarding, all-inclusive, Tide:

Document	Required?
ID (passport / driving licence / photo ID)	Yes
Proof of address (utility / bank statement, last 3 months)	Yes
Additional documents	Optional

Other products: union of their own document lists; same id asked once.

5.4 Pricing — no VAT

- Wizard review: listed price only, labelled **No VAT**.
- CRM create, drafts, website ingest: `vat = 0`, `total = price`.
- Existing orders and invoices were stripped so totals equal the net price.
- Editing an order price no longer splits 20% VAT.
- Invoice emails hide the VAT row when tax is zero.

This is **not** VAT Registration as a product (that catalogue item still exists as a service name).

6. WordPress / website integration

Plugin: `wordpress_plugin/brixen-crm-sync` on brixenconsultants.com.

Direction	What happens
Website checkout → CRM	Signed webhook creates/updates client, order, line items, company when it is a formation order
Website user → CRM	User sync / SSO (<code>/api/v1/auth/sso</code>)
CRM → Website	Provision Normal customer WordPress login (<code>provision-customer</code>)
Products	Optional WooCommerce product sync into CRM services

Website formation orders wait on **Company Registered** until staff confirm the company name. Named companies become cards. Companies House fills official details when a number is matched. Guest checkout without a matching user is held as pending verification, not assigned to a real client.

7. Companies House

- Live name/number search in Create Order, Add Company, and rename-before-registration.
- After a company is selected, search must **not** loop (select closes the live-search UI).
- Registered cards show official number, address, directors, status.
- Attention flags from CH (overdue accounts, confirmation statement, default address, strike-off).
- Optional compliance emails (off until enabled in settings). Daily window is configured; only verified business emails receive them.

- Brixen is **not** Companies House. Compliance emails use a small disclaimer only on COMPLIANCE / COMPANIES_HOUSE / KYC notices.
-

8. Email (transactional)

Shared engine: `email_engine.py` .

Every outbound email has a category: `COMPLIANCE` , `COMPANIES_HOUSE` , `KYC` , `DOCUMENT` , `CUSTOMER_UPLOAD` , `INVOICE` , `PAYMENT` , `ORDER` , `ACCOUNT` , `SECURITY` , `STAFF` , `SYSTEM` , `MARKETING` .

- From: **Brixen Consultants**
- Reply-To: `contact@brixenconsultants.com`
- Matching plain-text part; no open-tracking pixels
- Signature: Kind regards → The Brixen Consultants Team → Brixen Consultants Ltd → contact from System Settings
- Compliance disclaimer **only** on company-record compliance notices, small, after the signature

Invoices, welcome, password, and ordinary account emails do **not** carry the Companies House disclaimer.

9. Documents and KYC

- Client and staff upload (PDF, JPG, PNG, DOC, DOCX; additional also ZIP).
 - Files stored under `storage/` (not in git, not rsynced to production as a replace).
 - Order wizard attaches uploaded files to the new order.
 - Lifecycle review before they become Posted Documents in the company vault.
 - Customer checkout uploads appear on the order and in Customer Uploads.
-

10. Roles, permissions, and Super Admin

Roles: `SUPER_ADMIN` , `ADMIN` , `MANAGER` , `STAFF` , `CLIENT` .

- Super Admin / owner has full access, including **force-delete** of locked genuine orders, companies, and customers.
- Price edits on orders/invoices are administrator-only.
- Record delete is restricted to administrator accounts.
- Staff departments gate tasks.
- Managers see a filtered customer/order set where coded.

Genuine-record lock (`data_protection.py`): real client orders, numbered UK companies, and invoices are not wiped by seed scripts or automatic cleanup. Super Admin must explicitly force-delete.

11. Permanent manual deletes

When Super Admin / staff **manually delete** a customer, company, or order:

1. The live row tree is hard-deleted from `hypetex.db`.
2. Fingerprints (email, company number, WordPress user id, order number) are written to `storage/permanent_purge_ledger.json` **outside** the database.
3. Matching rows are scrubbed from backup `.db` files.
4. On startup, the ledger is enforced again.

Those fingerprints are **never restored** from backups or chat context. Disaster recovery of **other** data is allowed; purged emails / numbers stay gone.

Do not recreate a client with a purged email, or re-import a purged company/order number, unless the owner explicitly asks for a **new** account (not an undelete).

12. Database and performance

- SQLite with WAL, `synchronous=NORMAL`, large cache, mmap.
- Thread-local connections (`db.py`).
- Covering indexes on hot paths (companies by user/created, orders, line items, etc.).
- Dashboard and company lists avoid N+1 queries.

Passwords: Argon2id (legacy hashes upgraded on login).

13. Main code files

File	Role
app.py	HTTP API, auth, orders, companies, invoices, WordPress, email send
db.py	SQLite, schema migrate, indexes, password hashing
schema.sql	Tables: users, companies, orders, invoices, documents, tasks, ...
templates/index.html	Single-page UI
static/js/app.js	All portal behaviour (wizard, portfolio, customers, ...)
static/css/styles.css	Theme, portfolio, wizard tray
product_catalog_config.py	Per-product forms and KYC document rules
email_engine.py	HTML/text transactional layouts
data_protection.py	Genuine-record locks
permanent_purge.py	Manual-delete ledger
compliance_alerts.py	Scheduled CH attention emails
wordpress_plugin/brixen-crm-sync/	Website plugin (deployed on WordPress, not via CRM rsync)

14. How production is updated

After a code change, the app is published to the live portal.

Copied: app.py, db.py, schema.sql, data_protection.py, permanent_purge.py, templates/index.html, static/js/app.js, static/css/styles.css

Never copied: hypetex.db, .env*, .admin_credentials, storage/, venv/, logs, __pycache__, .git, wordpress_plugin/, seed_db.py

Steps: timestamped backup of app files → rsync those files → `chown brixen:brixen` → `systemctl restart brixen-crm` → confirm `127.0.0.1:5050` and HTML asset versions.

Do not change Nginx, SSL, or the systemd unit as part of a normal feature deploy. Do not run `seed_db.py` on production.

15. API map (high level)

Auth: /api/auth/login, /logout, /me, /forgot-password, /reset-password, /profile

SSO: /api/v1/auth/sso

WordPress: /api/v1/wordpress/webhook, sync-users, sync-orders, sync-products, documents

Client: /api/client/dashboard , orders , companies , invoices , documents , tickets , notifications , accountancy

Staff: /api/admin/customers , companies , orders , staff , invoices , documents , intake , settings , tasks , accountancy

Orders: POST /api/admin/orders and POST /api/client/orders (Create New Order), POST /api/orders/draft

All mutating APIs require a session cookie (and staff permissions where applicable).

16. Business rules to remember

1. **Normal = website login. B2B = this portal.**
 2. **Create New Order** can include many products; questions and KYC files are asked once.
 3. **ID + Proof required; Additional optional.**
 4. **No VAT on orders or invoices.** Listed price is the total.
 5. **Company Registered** landing page = registered companies, newest first. Click a card for official details.
 6. **Manual deletes are permanent.** Purged emails/numbers never come back from backup.
 7. **Locked genuine data** is not auto-wiped. Super Admin force-delete only.
 8. **Do not restore lbad-reassigned confidential companies** or purged records unless the owner explicitly asks for new data.
 9. Emails are transactional, UK professional, category-driven. No Companies House disclaimer on invoices or password mail.
 0. Website plugin and production database are not replaced by a normal CRM file deploy.
-

17. Typical staff workflows

New Normal customer for website login

Customers → Create Customer → Normal → save. They use the website. If the email already exists, details are updated.

New B2B portal client

Create Customer → B2B → they sign in at portal.brixenconsultants.com.

Place an order in CRM

Orders → Create New Order → customer → tick products → one details form → ID + Proof → submit. Total has no VAT.

See a newly registered company

Company Registered (default Companies House filter). Newest card at the top. Click for Overview.

Website formation arrived without a name

Company Registered → Not registered → confirm the name / match Companies House → card becomes registered.

Remove a client for good

Super Admin delete. Ledger records the email. That address cannot be used again.

This document describes the CMS as implemented in the Brixen portal codebase and published to <https://portal.brixenconsultants.com>.
